

Indications for planting

Dear GRIBA client!

To favor an early and homogenous start of your young orchard, GRIBA considers to keep the following indications during the planting:

1. The plants cannot be planted under a soil temperature of 8° C.
2. The soil should be fine structured (no big, rough soil bulbs!).
3. After delivery the trees should be put in to water (30-40 cm) for at least 48 hours.
(Use plastic boxes, trailers or open water)
4. During the planting, the plants should be well protected, in order to not directly expose them to the weather conditions. (wind, sun)
5. The roots should be covered with at least 10 cm of soil.
6. Immediately after planting, the soil around the roots should be pressed on.
7. The same day, every tree should be irrigated with 8-10 liters of water.
8. It is necessary to go on with irrigation twice a week with 4 to 5 liters/plant.
9. In case of dropping system bring out 4 liters/plant 3 times a week.
10. If you use an Anti-Frost system give 10 mm of water every 3 days.

Whish you a good success!

Your GRIBA-Team
